

## COSC 335 – Milestone 2

### Spring 09

Objective: Build a working filesystem.

This project will require you to take a simulated disk and design a simple filesystem for that disk. The structure of the filesystem is based off of UNIX-based filesystems.

Your project description can be found in your book, pages 481-487. Be sure to read all parts of the description, including the hints, the README in the source package and all comments in the source files. The simulator and framework are available on the OS course website on my faculty page.

Deliverables: the filesystem java source. All code should be clear, concise and well commented.

DUE: 4/24, 11:59 pm. Code is to be submitted via Digital Dropbox, not via email.
